INTRODUCTION

The present catalogue of the Family Ricaniidae forms Part 16 of Fascicle IV of the General Catalogue of the Homoptera of the World which is devoted to the Superfamily Fulgoroidea.

CLASSIFICATION ADOPTED

The classification adopted in the present catalogue is a modification of the one proposed by Melichar in 1923.

CHARACTERS OF THE FAMILY RICANIIDAE

The family Ricaniidae is one of the smaller families of the Fulgoroidea. The present catalogue contains 41 genera and 352 species.

The species in this family are frequently confused with members of the families Flatidae, Nogodinidae, and Acanaloniidae because of the large tegmina and their general resemblance to moths. These four families may be readily separated by the following characters: The Acanaloniidae have the costal vein in the margin of the tegmina and no crossveins on the costal border and usually no subapical line. But the other three families have the costal vein at some distance from the costal margin and numerous crossveins on the costal border, and usually one or two subapical lines on the tegmina. In the Flatidae the basal area of the clavus is pustulate while in the Ricaniidae and Nogodinidae there are no pustules. The Nogodinidae have the basal segment of the hind tarsus usually longer than the second and third segments combined with a spine on each side and roundly or conically produced between the spines. In the Ricaniidae the basal segment of the hind tarsus is very small without lateral spines. The general characters of the family may be briefly summarized as follows: Head, including the compound eyes, usually as wide as, or nearly as wide as, the pronotum. Vertex short and broad, nearly rectangular in outline, usually carinate on all margins. Frons rather large with lateral carinae strongly elevated, sometimes with median and infrequently with intermediate carinae; median carina sometimes percurrent. Clypeus much narrower than frons, triangular, usually with a median carina but no lateral carinae. Antennae short, basal segment short, collarlike, second segment usually subglobular, flagellum elongate, usually shorter than the total length of the insect. Pronotum short, with a median carina. Mesonotum large, tricarinate, convex; tegulae usually large. Tegmina large, broadly triangular; costal and commissural margins usually nearly straight, divergent, apical margin long, usually nearly straight, occasionally broadly rounded; costal membrane broad with numerous crossveins; corium with supernumerary veins and many crossveins; clavus not granulate, with the claval

veins usually united beyond the middle, the common stem united to the commissural margin before the apex of the clavus or continuing to the apex of the clavus. The tegmina vary greatly in texture, sometimes nearly opaque, with or without semitransparent areas, sometimes entirely translucent or transparent. The venation of tegmina also varies greatly; typically radius, media, and cubitus with supernumerary veins, with usually a definite subapical line or two subapical lines of transverse veins. Costa arising from the base of the basal cell; radius, media, and first and second cubitus all arising from the apex of the basal cell. In other genera the venation is greatly reduced, sometimes with only a few crossveins on the costal border. The wings smaller than the tegmina, venation considerably reduced but cubitus with several branches; crossveins relatively few. Legs simple with the front and middle legs small; hind femora large; hind tibiae elongate with one or more spines on the lateral margin and the apex with a crown of seven or more apical spines; first segment of hind tarsi usually shorter than second and third together without spines at the apex.

The male genitalia have the genital styles elongate, sometimes longer than pygofer; when viewed laterally usually with an elongate dorsal tooth at or near the apex. Aedeagus usually short and stout with a complicated pattern of apical spines and processes. In the few genera that I have examined the female genitalia are incomplete; pygofer undeveloped with the three pairs of valvulae exposed, the third pair often greatly developed.

HISTORICAL RÉSUMÉ

Twenty-six of the forty-one recorded genera were described by Stål, Melichar, and Distant, and these same authors together with Bergroth, Germar, Jacobi, Kirby, Kirkaldy, Lallemand, Schmidt, Signoret, and Walker are responsible for most of the species recognized in this catalogue. Melichar 1923a: 120 gives keys to and descriptions of the thirty-three genera that were known at that time and a detailed catalogue of the known species.

GEOGRAPHIC DISTRIBUTION

All the species in this family with the exception of two are from the Eastern Hemisphere. Twenty-four of the species in the present catalogue have a distribution covering two or more zoogeographic regions. The other species are recorded as follows: 15 from the Palearctic Region, 107 from the Ethiopian Region, 32 from the Oriental Region, 68 from the Malaysian Region, 41 from the Austromalayan Region, 25 from the Australian Region, and 38 from the Oceanic Region.

The known geographic distribution of each species is indicated by superscript figures at the end of the lines, which correspond to geographic regions

designated by the same superscript figures. In general we have indicated the distribution as given by the author of the reference, using the country as the smallest unit except in the larger countries, where states and provinces are used as the smallest units. In the larger island groups the individual islands are indicated wherever possible, in view of the importance of island endemism.

THE PURPOSES TO BE SERVED BY A CATALOGUE OF INSECTS

A catalogue of animals should serve practically all fields of biology. It should be, therefore, as complete a listing of all the records of families, subfamilies, tribes, genera, species, and varieties as it is possible for the author to assemble. The nature of the reference is of the greatest importance. A student of zoogeography should be able to find a complete list of the regions inhabited by the various species. The student of ecology should be able to find references to all that is known about the life history, food plants, and other pertinent data. The student of economic entomology should be able to check the histories of those species that are suspected of being injurious to plants. The plant disease specialist should be able to check the current nomenclature of the species which are disease vectors or suspected of being disease vectors. Those research workers studying morphology, physiology, or genetics should be able to trace the development in the field of their special interest. And lastly, the student of taxonomy should be relieved of the burden of searching for past recordings, and the journals which publish taxonomic papers should not have to pay the cost of publishing the past records and duplicating the synonymy that is already well known. Thus it would be necessary only to record synonymy which has been developed since the publication of the catalogue. Incidentally, I am pleased to note an increase in the method of literature citations developed in my *Bibliography of the Homoptera Auchenorrhyncha*. Thus Smith 1950a: 63 is a better method of citation than the present method: Smith, Ann. Mag. Nat. Hist (12) 5: 63.

Unfortunately this method was not adopted in the earlier numbers of this series and since about three-fourths of the catalogues are in manuscript, it was not deemed wise to make this change at this time.

FORM OF THE PRESENT CATALOGUE

This catalogue follows the general form of the present series. The family is divided into genera which are arranged in as nearly a phylogenetic order as our present knowledge will permit. The species are arranged under the genera in alphabetic sequence. Titles of books are not abbreviated but are condensed if they are unduly long. The abbreviations of journal references follow in general the scheme proposed in the *World List of Scientific Pe-*

riodicals with minor exceptions, the chief difference being that the names of countries, states, cities and other geographical units are not abbreviated. A few references are listed under their titles rather than under the abbreviations of the journals in which they were published, because in these cases the titles are usually better known than the journals, for example, Van Duzee 1917 Catalogue of Hemiptera of American North of Mexico *not* Techn. Bull. California Agr. Exp. Sta. Ent. 2. If the journal has been published in series the abbreviation of the journal is followed by a series number or by such an abbreviation as n. s. (new series), o. s. (old series), n. f. (neue Folge), or the like. This is followed by a note indicating the nature of the reference.

The notes which follow the references are generally self explanatory, but three points may be mentioned here. Such notations as "[described]," "[notes]," "[key]," and the like are intended to be suggestive rather than precise or exclusive. The notation "[error]" means not accepted in this catalogue. Usually the latest published synonymy is accepted, but not always. The other notation "[comparative note]" is used to designate those references, often of the greatest taxonomic significance, in which two generic, specific or other groups are compared. All references have been checked against the original save those marked with an asterisk (*), which have been accepted from reliable sources. Every effort has been made to have the references full and complete and to give an indication of the character of the data contained. Where the writer knows that reprints have been issued with different pagination, this is indicated in parentheses following the page numbers of the original. In a few cases, where the matter has been reprinted under a different title with different pagination, separate references are given. Where authentic editions have been published these have been indicated by separate references. Genera established without included species have been dated from their original description, with their type fixation dated at the time of the first inclusion of species. Original spellings have been retained in all cases, except obvious typographical errors. Typographical errors are indicated by placing "[sic]" after the misspelled name. This is not for the purpose of calling attention to the mistakes authors have made but to make certain that students following the catalogue have a clear understanding of what is implied.

The determination of obvious typographical errors is not always easy. These errors range all the way from clearly apparent transpositions of letters, to misspelled names of individuals, geographical names, and many others of like character. However, so many generic names have been formed by the transposition and substitution of letters that one is often at a loss to know which names are misspelled and which are not. For example, *Neokolla* and *Keonolla*, or *Alebra*, *Elebra*, and *Eualebra*.

All variations in spelling save those which refer to endings only, are appropriately cross-referred. The species have also been listed under every known generic combination so that it is possible to find any species without recourse to the index, which will be published at the completion of the Fascicle, together with the full bibliography.

The writer takes no pride in the authorship of *nomen nova*. He uses them only when he thinks they are necessary. No new names are proposed for species or genera described by living authors without first giving the original author an opportunity to correct primary or secondary homonyms.

A catalogue is not a revision of a group and the location of the genera and species in the present catalogue is merely an attempt to reflect what is believed to be the general consensus of the best authorities at the present time. Doubtful genera and species have been included to call them to the attention of subsequent revisers.

An attempt has been made throughout this catalogue to interpret all references in the light of the period in which they were published. This is not always easy and leads perhaps to erroneous conclusions at times, but it is certainly much sounder from the standpoint of nomenclature than the tendency to evaluate references from previous decades in the light of present day practices and procedures.

In the present number of this series we have departed from our previous method of giving latinized names to varieties which in the past have been designated by Arabic letters, Greek letters, numbers, or other designations. All varieties are catalogued, however, under the first designation regardless of its form. Some of these varieties may prove to be valid species with further study and then may be given latinized designations.

Primary homonyms of species have been replaced by *nomen nova*; secondary homonyms have been restored to their original names if the homonym has been relieved by moving one or the other or both species to other genera.

All specific endings have been modified to agree with the suggestions made by Blackwelder 1940, *Journal of the Washington Academy of Sciences* **31**: 135-140. There are certain disadvantages inherent in this method, but it seems to the writer that these limitations are outweighed by the advantages of this system. We are confronted by so many coined words that can have no sex that it seems better to use this system and disregard apparent violations of Latin and Greek grammar. Where the sex of generic names can be determined the appropriate adjustments are made in the specific names.

In a detailed catalogue such as this it is practically impossible to eliminate all errors. The author will appreciate it very much if his attention is directed to all such mistakes. It is especially easy to overlook local lists

when published in the proceedings of local natural history societies, references to species of economic importance when published in scientific agricultural journals, references to vectors of plant diseases when published in phytopathological journals, and many other references of a similar nature. It will be very much appreciated if authors will send me reprints of all articles dealing with the Homoptera Auchenorrhyncha so that this material may be included in future catalogues to make them as complete as possible. Also it would seem to the author that changes in the nomenclature adopted in this catalogue should not be made in the future without a full explanation.

All literature available to the writer before November 1, 1954 has been included in this catalogue.
